Package 'VEMIRT'

October 31, 2025

```
Type Package

Title Variational Expectation Maximization for High-Dimensional IRT Models

Version 2.12

Date 2025-10-31

Maintainer Weicong Lyu <weiconglyu@um.edu.mo>

Description
```

VEMIRT is created to assist researchers in conducting high-dimensional exploratory and confirmatory multidimensional item response theory (MIRT) analysis and corresponding differential item functioning (DIF) analysis. The core computation engine of VEMIRT is a family of Gaussian Variational EM algorithms that are considerably more efficient than currently available algorithms.

sian Variational EM algorithms that are considerably more efficient than currently available algorithms in other statistical packages, especially when the number of latent factors exceeds four.

Description

VEMIRT is created to assist researchers to conduct exploratory and confirmatory multidimensional item response theory (MIRT) analysis and cooresponding item differential functioning (DIF) analysis. The core computation engine of VEMIRT is a family of Gaussian Variational EM algorithms that are considerably more efficient than currently available algorithms in other software packages, especially when the number of latent factors exceeds four.

Identifying the number of factors

pa_poly identifies the number of factors via parallel analysis.

Exploratory factor analysis

- E2PL_gvem_rot conducts M2PL Analysis with post-hoc rotation (Promax & CF-Quartimax)
- E2PL_gvem_lasso conducts M2PL Analysis with Lasso penalty
- E2PL_gvem_adaptlasso conducts M2PL Analysis with adaptive Lasso penalty
- E2PL_iw conducts importance sampling to correct bias for M2PL analysis
- E3PL_sgvem_rot conducts stochastic GVEM to further improve the computational effficiency for exploratory M3PL analysis
- E3PL_sgvem_lasso conducts M3PL Analysis with Lasso penalty
- E3PL_sgvem_adaptlasso conducts M3PL Analysis with adaptive Lasso penalty
- MGRM_gvem conducts GVEM for the multidimensional graded response model with post-hoc rotation
- MGPCM_gvem conducts GVEM for the multidimensional partial credit model with post-hoc rotation

Confirmatory factor analysis

- C2PL_gvem conducts GVEM for confirmatory M2PL analysis
- C2PL_bs conducts bootstrap sampling to correct bias and produce standard errors for confirmatory M2PL analysis
- C2PL_iw conducts importance sampling to correct bias for M2PL analysis
- C2PL_iw2 conducts IW-GVEM for confirmatory M2PL analysis (alternative implementation to C2PL_iw)
- C3PL_sgvem conducts stochastic GVEM for confirmatory M3PL analysis
- MGRM_gvem conducts GVEM for the multidimensional graded response model
- MGPCM_gvem conducts GVEM for the multidimensional partial credit model

4 C1PL_data

Differential item functioning analysis

- D1PL_em conducts DIF analysis for M1PL models using EM algorithms
- D1PL_gvem conducts DIF analysis for M1PL models using GVEM algorithms
- D2PL_em conducts DIF analysis for M2PL models using EM algorithms
- D2PL_pair_em conducts DIF analysis for 2PL models using EM algorithms with group pairwise truncated L_1 penalty
- D2PL_gvem conducts DIF analysis for M2PL models using GVEM algorithms
- D2PL_1rt conducts DIF analysis for M2PL models using the likelihood ratio test

Shiny apps for VEMIRT

- shinyVEMIRT Run the shiny app for VEMIRT
- DIFdashboard Run the shiny app for DIF Dashboard

C1PL_data

Simulated Data Set for Confirmatory M1PL Analysis

Description

Responses are simulated based on an M1PL model with 2 factors. The true factor correlations are set as 0.8.

Usage

C1PL_data

C2PL_bs 5

Format

A list of components of the data set:

data Item responses

model Loading indicators

params True parameters used for generating the item responses

Author(s)

Weicong Lyu <weiconglyu@um.edu.mo>

C2PL_bs

Bootstrap Version of GVEM Confirmatory Analysis for M2PL

Description

A bootstrap version of GVEM (i.e., GVEM-BS) can be implemented to correct the bias on item parameters and compute standard errors under confirmatory M2PL models

Usage

```
C2PL_bs(gvem_result, boots = 5)
```

Arguments

gvem_result a list that includes exploratory or confirmatory GVEM results for M2PL models. boots the number of bootstrap samples; default is 5

Value

a list containing the following objects:

boots_a item discrimination parameters corrected by bootstrap sampling, a $J \times K$ matrix boots_b item difficulty parameters corrected by bootstrap sampling, a vector of length J stardard errors of item discrimination parameters, a $J \times K$ matrix sd_b stardard errors of item difficulty parameters, a vector of length J

Author(s)

Jiaying Xiao <jxiao6@uw.edu>

See Also

```
C2PL_gvem, C2PL_iw
```

Examples

```
## Not run:
gvem_result <- with(C2PL_data, C2PL_gvem(data, model))
C2PL_bs(gvem_result, boots=10)
## End(Not run)</pre>
```

6 C2PL_gvem

C2PL_data Simulated Data Set for Confirmatory M2PL Analysis	
---	--

Description

Responses are simulated based on an M2PL model with 2 factors. The true factor correlations are set as 0.8.

Usage

C2PL_data

Format

A list of components of the data set:

data Item responses

model Loading indicators

params True parameters used for generating the item responses

Author(s)

Weicong Lyu <weiconglyu@um.edu.mo>

C2PL_gvem	Confirmatory M2PL Analysis

Description

Confirmatory M2PL Analysis

Usage

```
C2PL_gvem(u, indic, max.iter = 5000, SE.est = FALSE)
```

Arguments

u	an $N \times J$ matrix or a data. frame that consists of binary responses of N individuals to J items. The missing values are coded as NA
indic	a $J \times K$ matrix or a data. frame that describes the factor loading structure of J items to K factors. It consists of binary values where 0 refers to the item is irrelevant with this factor, 1 otherwise
max.iter	the maximum number of iterations for the EM cycle; default is 5000
SE.est	whether to estimate SE for item parameters using the updated supplemented expectation maximization (USEM); default is FALSE

Value

a list containing the following objects:

ra	item discrimination parameters, a $J \times K$ matrix
rb	item difficulty parameters, vector of length J
reta	variational parameters $\eta(\xi)$, a $N \times J$ matrix
reps	variational parameters ξ , a $N \times J$ matrix
rsigma	population variance-covariance matrix, a $K \times K$ matrix
mu_i	mean parameter for each person, a $K \times N$ matrix
sig_i	covariance matrix for each person, a $K \times K \times N$ array
n	the number of iterations for the EM cycle
Q_mat	factor loading structure, a $J \times K$ matrix
GIC	model fit index
AIC	model fit index
BIC	model fit index
SE	Standard errors of item parameters, a $J \times (K+1)$ matrix where the last column

includes SE estimates for item difficulty parameters

Author(s)

Jiaying Xiao <jxiao6@uw.edu>

See Also

```
C3PL_sgvem, C2PL_bs, C2PL_iw
```

Examples

```
## Not run:
with(C2PL_data, C2PL_gvem(data, model))
## End(Not run)
```

C2PL_iw

Importance Weighted Version of GVEM Analysis for M2PL Models

Description

An importance weighted version of GVEM (i.e., IW-GVEM) can be implemented to correct the bias on item parameters under M2PL models

Usage

```
C2PL_iw(u, gvem_result, S = 10, M = 10, max.iter = 10)
E2PL_iw(u, gvem_result, S = 10, M = 10, max.iter = 10)
```

Arguments

u a $N \times J$ matrix or a data. frame that consists of binary responses of N indi-

viduals to J items. The missing values are coded as NA

gvem_result a list that includes exploratory or confirmatory GVEM results for M2PL models.

S the number of times to draw samples; default is 10

M the number of samples drawn from the variational distributions; default is 10

max.iter the maximum number of iterations for the EM cycle; default is 10

Value

a list containing the following objects:

ra item discrimination parameters estimated by GVEM, a $J \times K$ matrix

rb item difficulty parameters estimated by GVEM, vector of length J

reta variational parameters $\eta(\xi)$, a $N \times J$ matrix reps variational parameters ξ , a $N \times J$ matrix

rsigma population variance-covariance matrix estimated by GVEM, a $K \times K$ matrix

mu_i mean parameter for each person, a $K \times N$ matrix sig_i covariance matrix for each person, a $K \times K \times N$ array

n the number of iterations for the EM cycle

rk factor loadings, a $J \times K$ matrix, for exploratory analysis only

Q_mat factor loading structure, a $J \times K$ matrix

GIC model fit index

AIC model fit index

BIC model fit index

SE Standard errors of item parameters, a $J \times (K+1)$ matrix where the last column

includes SE estimates for item difficulty parameters, for confirmatory analysis

only

ur_a item discrimination parameters before conducting the rotation, a $J \times K$ matrix,

for exploratory analysis only

new_a item discrimination parameters estimated by IW-GVEM, a $J \times K$ matrix new_b item difficulty parameters estimated by IW-GVEM, vector of length J

new_Sigma_theta

population variance-covariance matrix estimated by IW-GVEM, a $K \times K$ matrix

best_lr The learning rate used for importance sampling best_lb The lower bound value for importance sampling

Author(s)

Jiaying Xiao <jxiao6@uw.edu>

See Also

```
C2PL_gvem, E2PL_gvem_rot, C2PL_bs
```

Examples

```
## Not run:
CFA_result <- with(C2PL_data, C2PL_gvem(data, model))
C2PL_iw(C2PL_data$data, CFA_result)
## End(Not run)
## Not run:
EFA_result <- with(E2PL_data_C1, E2PL_gvem_lasso(data, model, constrain = constrain, non_pen = non_pen))
E2PL_iw(E2PL_data_C1$data, EFA_result)
## End(Not run)</pre>
```

C2PL_iw2

IW-GVEM Algorithm for Confirmatory M2PL Analysis

Description

IW-GVEM Algorithm for Confirmatory M2PL Analysis

Usage

```
C2PL_iw2(
   data,
   model = matrix(1, ncol(data)),
   criterion = "BIC",
   iter = 200,
   eps = 0.001,
   c = 1,
   S = 10,
   M = 10,
   lr = 0.1,
   SE.level = NULL
)
```

Arguments

data	An $N \times J$ binary matrix of item responses (missing responses should be coded as NA)
model	A $J \times K$ binary matrix of loading indicators (all items load on the only dimension by default)
criterion	Information criterion for model selection, one of 'GIC' (recommended), 'BIC', or 'AIC' $$
iter	Maximum number of iterations
eps	Termination criterion on numerical accuracy
С	Constant for computing GIC
S	Sample size for approximating the expected lower bound
М	Sample size for approximating a tighter lower bound
lr	Learning rate for the Adam optimizer
SE.level	Accuracy level of Gaussian quadrature for mvQuad to compute standard errors (SEs are not computed if SE.level is NULL)

Value

An object of class vemirt_DIF, which is a list containing the following elements:

N	Number of respondents
niter0	Number(s) of iterations for initialization
fit	The only element of all
best	Equal to 1
all	A list of model which has one element:
\$niter	Number(s) of iterations
\$SIGMA	Person-level posterior covariance matrices
\$MU	Person-level posterior mean vectors
\$Sigma	Population covariance matrix
\$Mu	Population mean vector
\$a	Slopes
\$b	Intercepts
\$SE.a	Standard errors of a
\$SE.b	Standard errors of b
\$11	Estimated lower bound of log-likelihood
\$10	Number of nonzero elements in model
\$AIC	Akaike Information Criterion: -2*11+10*2
\$BIC	Bayesian Information Criterion: -2*11+10*log(N)
\$GIC	Generalized Information Criterion: -2*11+c*10*log(N)*log(log(N))

C3PL_data 11

C3PL_data

Simulated Data Set for Confirmatory M3PL Analysis

Description

Responses are simulated based on an M3PL model with 2 factors. The true factor correlations are set as 0.8.

Usage

```
C3PL_data
```

Format

A list of components of the data set:

data Item responses

model Loading indicators

params True parameters used for generating the item responses

Author(s)

Weicong Lyu <weiconglyu@um.edu.mo>

 ${\tt C3PL_sgvem}$

Stochastic GVEM for Confirmatory M3PL Analysis

Description

Stochastic GVEM for Confirmatory M3PL Analysis

Usage

```
C3PL_sgvem(
    u,
    indic,
    samp = 50,
    forgetrate = 0.51,
    mu_b,
    sigma2_b,
    Alpha,
    Beta,
    max.iter = 5000
```

12 C3PL_sgvem

Arguments

u an $N \times J$ matrix or a data. Frame that consists of binary responses of N indi-

viduals to J items. The missing values are coded as NA

indic a $J \times K$ matrix or a data. frame that describes the factor loading structure of

J items to K factors. It consists of binary values where 0 refers to the item is

irrelevant with this factor, 1 otherwise

samp a subsample for each iteration; default is 50

forgetrate the forget rate for the stochastic algorithm. The value should be within the range

from 0.5 to 1. Default is 0.51

mu_b the mean parameter for the prior distribution of item difficulty parameters sigma2_b the variance parameter for the prior distribution of item difficulty parameters

Alpha the α parameter for the prior distribution of guessing parameters

Beta the β parameter for the prior distribution of guessing parameters

max.iter the maximum number of iterations for the EM cycle; default is 5000

Value

a list containing the following objects:

ra item discrimination parameters, a $J \times K$ matrix rb item difficulty parameters, vector of length J rc item guessing parameters, vector of length J rs variational parameters s, a $N \times J$ matrix reta variational parameters $\eta(\xi)$, a $N \times J$ matrix variational parameters ξ , a $N \times J$ matrix

rsigma population variance-covariance matrix, a $K \times K$ matrix mu_i mean parameter for each person, a $K \times N$ matrix sig_i covariance matrix for each person, a $K \times K \times N$ array

n the number of iterations for the EM cycle Q_mat factor loading structure, a $J \times K$ matrix

GIC model fit index
AIC model fit index
BIC model fit index

D1PL_em

EM Algorithms for DIF Detection in M1PL Models

Description

EM Algorithms for DIF Detection in M1PL Models

Usage

```
D1PL_em(
    data,
    model = matrix(1, ncol(data)),
    group = rep(1, nrow(data)),
    a = 1,
    method = "EMM",
    Lambda0 = if (length(unique(group)) == 1) 0 else seq(0.1, 1, by = 0.1),
    level = 10,
    criterion = "BIC",
    iter = 200,
    eps = 0.001,
    c = 1,
    verbose = TRUE
)
```

D1PL_em

Arguments

An $N \times J$ binary matrix of item responses (missing responses should be coded data A $J \times K$ binary matrix of loading indicators (all items load on the only dimenmodel sion by default) An N dimensional vector of group indicators from 1 to G (all respondents are in group the same group by default) A scalar indicating the common discrimination parameter for all the dimensions а of all the items (takes 1 by default) method Estimation algorithm, one of 'EM' or 'EMM' Lambda0 A vector of lambda0 values for L_1 penalty (lambda equals sqrt(N) * lambda0) level Accuracy level, either a number for mvQuad or a vector indicating the grid for each latent dimension Information criterion for model selection, one of 'BIC' (recommended), 'AIC', criterion or 'GIC' iter Maximum number of iterations Termination criterion on numerical accuracy eps Constant for computing GIC С

Value

verbose

An object of class vemirt_DIF, which is a list containing the following elements:

Whether to show the progress

N	Number of respondents
niter0	Number(s) of iterations for initialization
fit	The best (with lowest information criterion) model, which is an element of all
best	The index of fit in all
all	A list of models which has the same length as Lambda0:
\$lambda0	Corresponding element in Lambda0
\$lambda	sqrt(N) * lambda0
\$niter	Number(s) of iterations
\$Sigma	Group-level covariance matrices
\$Mu	Group-level mean vectors
\$a	Slopes for group 1
\$b	Intercepts for group 1
\$gamma	D1PL parameters for the slopes (all elements are zero)
\$beta	D1PL parameters for the intercepts
\$11	Log-likelihood
\$10	Number of nonzero D1PL parameters in gamma and beta
\$AIC	Akaike Information Criterion: -2*11+10*2
\$BIC	Bayesian Information Criterion: -2*11+10*log(N)
\$GIC	Generalized Information Criterion: -2*11+c*10*log(N)*log(log(N))

D2PL_em

EM Algorithms for DIF Detection in M2PL Models

Description

EM Algorithms for DIF Detection in M2PL Models

Usage

```
D2PL_em(
  data,
  model = matrix(1, ncol(data)),
  group = rep(1, nrow(data)),
  method = "EMM",
  Lambda0 = if (length(unique(group)) == 1) 0 else seq(0.1, 1, by = 0.1),
  level = 10,
  criterion = "BIC",
  iter = 200,
  eps = 0.001,
  c = 1,
  verbose = TRUE
)
```

Arguments

data	An $N \times J$ binary matrix of item responses (missing responses should be coded as NA)
model	A $J \times K$ binary matrix of loading indicators (all items load on the only dimension by default)
group	An N dimensional vector of group indicators from 1 to ${\rm G}$ (all respondents are in the same group by default)
method	Estimation algorithm, one of 'EM' or 'EMM'
Lambda0	A vector of lambda0 values for L_1 penalty (lambda equals $sqrt(N) * lambda0$)
level	Accuracy level, either a number for mvQuad or a vector indicating the grid for each latent dimension
criterion	Information criterion for model selection, one of 'BIC' (recommended), 'AIC', or 'GIC'
iter	Maximum number of iterations
eps	Termination criterion on numerical accuracy
С	Constant for computing GIC
verbose	Whether to show the progress

Value

An object of class vemirt_DIF, which is a list containing the following elements:

N Number of respondents niter0 Number(s) of iterations for initialization D2PL_gvem 21

fit	The best (with lowest information criterion) model, which is an element of all
best	The index of fit in all
all	A list of models which has the same length as Lambda0:
\$lambda0	Corresponding element in Lambda0
\$lambda	sqrt(N) * lambda0
\$niter	Number(s) of iterations
\$Sigma	Group-level covariance matrices
\$Mu	Group-level mean vectors
\$a	Slopes for group 1
\$b	Intercepts for group 1
\$gamma	D2PL parameters for the slopes
\$beta	D2PL parameters for the intercepts
\$11	Log-likelihood
\$10	Number of nonzero D2PL parameters in gamma and beta
\$AIC	Akaike Information Criterion: -2*11+10*2
\$BIC	Bayesian Information Criterion: -2*11+10*log(N)
\$GIC	Generalized Information Criterion: -2*11+c*10*log(N)*log(log(N))

D2PL_gvem

GVEM Algorithms for DIF Detection in M2PL Models

Description

GVEM Algorithms for DIF Detection in M2PL Models

D2PL_gvem

Usage

```
D2PL_gvem(
   data,
   model = matrix(1, ncol(data)),
   group = rep(1, nrow(data)),
   method = "IWGVEMM",
   Lambda0 = if (length(unique(group)) == 1) 0 else seq(0.1, 1, by = 0.1),
   criterion = "GIC",
   iter = 200,
   eps = 0.001,
   c = 1,
   S = 10,
   M = 10,
   lr = 0.1,
   verbose = TRUE
)
```

Arguments

data	An $N\times J$ binary matrix of item responses (missing responses should be coded as NA)
model	A $J \times K$ binary matrix of loading indicators (all items load on the only dimension by default)
group	An N dimensional vector of group indicators from 1 to ${\bf G}$ (all respondents are in the same group by default)
method	Estimation algorithm, one of 'GVEM' or 'IWGVEMM'
Lambda0	A vector of lambda0 values for L_1 penalty (lambda equals $sqrt(N) * lambda0$)
criterion	Information criterion for model selection, one of 'GIC' (recommended), 'BIC', or 'AIC' $$
iter	Maximum number of iterations
eps	Termination criterion on numerical accuracy
С	Constant for computing GIC
S	Sample size for approximating the expected lower bound ('IWGVEMM' only)
М	Sample size for approximating a tighter lower bound ('IWGVEMM' only)
lr	Learning rate for the Adam optimizer ('IWGVEMM' only)
verbose	Whether to show the progress

Value

An object of class vemirt_DIF, which is a list containing the following elements:

N	Number of respondents

    criterion = "BIC",
  iter = 200,
  eps = 0.001,
    c = 1,
  verbose = TRUE
)
```

D2PL_pair_em 25

Arguments

data An $N \times J$ binary matrix of item responses (missing responses should be coded

as NA)

group An N dimensional vector of group indicators from 1 to G (all respondents are in

the same group by default)

Lambda θ A vector of lambda θ values for truncated L_1 penalty (lambda equals sqrt(N) /

G * lambda0)

Tau A vector of tau values for truncated L_1 penalty (becomes L_1 penalty when tau

equals Inf)

rho0 A value of rho for augmented Lagrangian in ADMM (tau equals sqrt(N) / G

+ + 2110)

level Accuracy level of Gaussian quadrature for mvQuad

criterion Information criterion for model selection, one of 'BIC' (recommended), 'AIC',

or 'GIC'

iter Maximum number of iterations

eps Termination criterion on numerical accuracy

c Constant for computing GIC verbose Whether to show the progress

Value

An object of class vemirt_DIF, which is a list containing the following elements:

N Number of respondents

niter0 Number(s) of iterations for initialization

fit The best (with lowest information criterion) model, which is an element of all

best The index of fit in all

all A list of models which has the same length as Lambda0:

...\$lambda0 Corresponding element in Lambda0

...\$lambda sqrt(N) / G * lambda0
...\$tau Corresponding element in Tau

...\$rho0 Same as rho0 in input ...\$rho sqrt(N) / G * rho0 ...\$niter Number(s) of iterations

...\$Sigma Group-level covariance matrices

...\$Mu Group-level mean vectors

...\$a Slopes...\$b Intercepts

...\$d.a Group pairwise differences of slopes
...\$d.b Group pairwise differences of intercepts

...\$u.a Lagrangian multipliers of corresponding elements in d.a ...\$u.b Lagrangian multipliers of corresponding elements in d.b

...\$11 Log-likelihood

...\$10 Number of nonzero D2PL parameters in gamma and beta

...\$AIC Akaike Information Criterion: -2*11+10*2

...\$BIC Bayesian Information Criterion: -2*11+10*log(N)

E2PL_gvem_adaptlasso Exploratory M2PL Analysis with Adaptive Lasso Penalty

Description

Exploratory M2PL Analysis with Adaptive Lasso Penalty

Usage

```
E2PL_gvem_adaptlasso(
    u,
    indic,
    max.iter = 5000,
    constrain = "C1",
    non_pen = NULL,
    gamma = 2
)
```

Arguments

u

an $N \times J$ matrix or a data. frame that consists of binary responses of N individuals to J items. The missing values are coded as NA

indic

a $J \times K$ matrix or a data. frame that describes the factor loading structure of J items to K factors. It consists of binary values where 0 refers to the item is irrelevant to this factor, and 1 otherwise. For exploratory factor analysis with adaptive lasso penalty, indic should include constraints on the a $K \times K$ submatrix to ensure identifiability. The remaining parts do not assume any prespecified zero structure but instead, the appropriate lasso penalty would recover the true zero structure. Also see constrain

max.iter

the maximum number of iterations for the EM cycle; default is 5000

constrain

the constraint setting: "C1" or "C2". To ensure identifiability, "C1" sets a $K \times K$ sub-matrix of indic to be an identity matrix. This constraint anchor K factors by designating K items that load solely on each factor respectively. Note that the $K \times K$ matrix does not have to appear at the top of the indic matrix. "C2" sets the $K \times K$ sub-matrix to be a lower triangular matrix with the diagonal being ones. That is, there are test items associated with each factor for sure and they may be associated with other factors as well. Nonzero entries (in the lower triangular part) except for the diagonal entries of the sub-matrix are penalized during the estimation procedure. For instance, assume K=3, then the "C2"

constraint will imply the following submatrix: $C2 = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$. As shown,

item 1 is allowed to only load on the first factor, item 2 will for sure load on the second factor but it may also load on the first factor (hence a penalty is added on the (2,1) element of "C2", i.e., $C2_{2,1}$). Item 3 will for sure load on the third factor but it may also load on the first two factors. However, note that for all remaining items their loading vector will all be (1,1,1) hence indistinguishable from the third anchor item. Therefore, we need to alert the algorithm that this third anchor item will for sure load on the third factor, and whether or not it loads on the first two factors depends on the regularization results. Therefore, we

need to specify "non_pen=" to identify the Kth anchor item. Although, "C2" is much weaker than "C1", it still ensures empirical identifiability. Default is "C1". During estimation, under both the "C1" and "C2" constraints, the population means and variances are constrained to be 0 and 1, respectively.

non_pen the index of an item that is associated with every factor under constraint "C2".

For C1, the input can be NULL

gamma a numerical value of adaptive lasso parameter. Zou (2006) recommended three

values, 0.5, 1, and 2. The default value is 2.

Value

a list containing the following objects:

ra item discrimination parameters, a $J \times K$ matrix item difficulty parameters, vector of length Jrb variational parameters $\eta(\xi)$, a $N \times J$ matrix reta variational parameters ξ , a $N \times J$ matrix reps population variance-covariance matrix, a $K \times K$ matrix rsigma mean parameter for each person, a $K \times N$ matrix mu_i sig_i covariance matrix for each person, a $K \times K \times N$ array the number of iterations for the EM cycle n factor loading structure, a $J \times K$ matrix Q_mat GIC model fit index

AIC model fit index
model fit index
model fit index

1bd numerical value of lasso penalty parameter λ

    Alpha,
    Beta,
    max.iter = 5000,
    constrain = "C1",
    non_pen = NULL,
    gamma = 2
)
```

Arguments

u an $N \times J$ matrix or a data. frame that consists of binary responses of N individuals to J items. The missing values are coded as NA

indic

a $J \times K$ matrix or a data. frame that describes the factor loading structure of J items to K factors. It consists of binary values where 0 refers to the item is irrelevant with this factor, 1 otherwise. For exploratory factor analysis with lasso penalty, indic should be imposed certain constraints on the a $K \times K$ sub-matrix

constrain

to ensure identifiability. The remaining parts do not assume any pre-specified zero structure but instead, the appropriate lasso penalty would recover the true zero structure. Also see constrain

a subsample for each iteration; default is 50 samp

the forget rate for the stochastic algorithm. The value should be within the range forgetrate

from 0.5 to 1. Default is 0.51

mu_b the mean parameter for the normal prior distribution of item difficulty parame-

the variance parameter for the normal prior distribution of item difficulty paramsigma2_b

eters

Alpha the α parameter for the beta prior distribution of guessing parameters Beta the β parameter for the beta prior distribution of guessing parameters the maximum number of iterations for the EM cycle; default is 5000 max.iter

the constraint setting: "C1" or "C2". To ensure identifiablity, "C1" sets a $K \times K$ sub-matrix of indic to be an identity matrix. This constraint anchor K factors by designating K items that load solely on each factor respectively. Note that the $K \times K$ matrix does not have to appear at the top of the indic matrix. "C2" sets the $K \times K$ sub-matrix to be a lower triangular matrix with the diagonal being ones. That is, there are test items associated with each factor for sure and they may be associated with other factors as well. Nonzero entries (in the lower triangular part) except for the diagonal entries of the sub-matrix are penalized during the estimation procedure. For instance, assume K=3, then the "C2"

 $\begin{bmatrix} 1 & 0 & 0 \end{bmatrix}$ constraint will imply the following submatrix: C2 =1 1 0

item 1 is allowed to only load on the first factor, item 2 will for sure load on the second factor but it may also load on the first factor (hence a penalty is added on the (2,1) element of "C2", i.e., $C2_{2,1}$). Item 3 will for sure load on the third factor but it may also load on the first two factors. However, note that for all remaining items their loading vector will all be (1, 1, 1) hence indistinguishable from the third anchor item. Therefore, we need to alert the algorithm that this third anchor item will for sure load on the third factor, and and whether or not it loads on the first two factors depends on the regularization results. Therefore, we need to specify "non_pen=" to identify the Kth anchor item. Although, "C2" is much weaker than "C1", it still ensures empirical identifiability. Default is "C1". During estimation, under both the "C1" and "C2" constraints, the population means and variances are constrained to be 0 and 1, respectively.

the index of an item which is associated with each factor to satisfy "C2". For non_pen

C1, the input can be NULL

a numerical value of adaptive lasso parameter. Zou (2006) recommended three gamma

values, 0.5, 1, and 2. The default value is 2.

Value

a list containing the following objects:

ra item discrimination parameters, a $J \times K$ matrix item difficulty parameters, vector of length J rb item guessing parameters, vector of length Jrc

36 E3PL_sgvem_lasso

rs	variational parameters s , a $N \times J$ matrix
reta	variational parameters $\eta(\xi)$, a $N \times J$ matrix
reps	variational parameters ξ , a $N \times J$ matrix
rsigma	population variance-covariance matrix, a $K\times K$ matrix
mu_i	mean parameter for each person, a $K \times N$ matrix
sig_i	covariance matrix for each person, a $K\times K\times N$ array
n	the number of iterations for the EM cycle
Q_mat	factor loading structure, a $J \times K$ matrix
GIC	model fit index
AIC	model fit index
BIC	model fit index
lbd	numerical value of lasso penalty parameter $\boldsymbol{\lambda}$

E3PL_sgvem_lasso

Stochastic GVEM with Lasso Penalty for Exploratory M3PL Analysis

Description

Stochastic GVEM with Lasso Penalty for Exploratory M3PL Analysis

E3PL_sgvem_lasso 37

Usage

```
E3PL_sgvem_lasso(
    u,
    indic,
    samp = 50,
    forgetrate = 0.51,
    mu_b,
    sigma2_b,
    Alpha,
    Beta,
    max.iter = 5000,
    constrain = "C1",
    non_pen = NULL
)
```

Arguments

u an $N \times J$ matrix or a data. frame that consists of binary responses of N individuals to J items. The missing values are coded as NA

indic a $J \times K$ matrix or a data. frame that describes the factor loading structure of

J items to K factors. It consists of binary values where 0 refers to the item is irrelevant with this factor, 1 otherwise. For exploratory factor analysis with lasso penalty, indic should be imposed certain constraints on the a $K \times K$ sub-matrix to ensure identifiability. The remaining parts do not assume any pre-specified zero structure but instead, the appropriate lasso penalty would recover the true

zero structure. Also see constrain

samp a subsample for each iteration; default is 50

forgetrate the forget rate for the stochastic algorithm. The value should be within the range

from 0.5 to 1. Default is 0.51

mu_b the mean parameter for the normal prior distribution of item difficulty parame-

ters

sigma2_b the variance parameter for the normal prior distribution of item difficulty param-

eters

Alpha the α parameter for the beta prior distribution of guessing parameters

Beta the β parameter for the beta prior distribution of guessing parameters

max.iter the maximum number of iterations for the EM cycle; default is 5000

constrain the constraint setting: "C1" or "C2". To ensure identifiablity, "C1" sets a $K \times K$

sub-matrix of indic to be an identity matrix. This constraint anchor K factors by designating K items that load solely on each factor respectively. Note that the $K \times K$ matrix does not have to appear at the top of the indic matrix. "C2" sets the $K \times K$ sub-matrix to be a lower triangular matrix with the diagonal being ones. That is, there are test items associated with each factor for sure and they may be associated with other factors as well. Nonzero entries (in the lower triangular part) except for the diagonal entries of the sub-matrix are penalized during the estimation procedure. For instance, assume K = 3, then the "C2"

constraint will imply the following submatrix: $C2 = \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 1 & 1 & 1 \end{bmatrix}$. As shown,

item 1 is allowed to only load on the first factor, item 2 will for sure load on the second factor but it may also load on the first factor (hence a penalty is added

38 E3PL_sgvem_lasso

on the (2,1) element of "C2", i.e., $C2_{2,1}$). Item 3 will for sure load on the third factor but it may also load on the first two factors. However, note that for all remaining items their loading vector will all be (1,1,1) hence indistinguishable from the third anchor item. Therefore, we need to alert the algorithm that this third anchor item will for sure load on the third factor, and and whether or not it loads on the first two factors depends on the regularization results. Therefore, we need to specify "non_pen=" to identify the Kth anchor item. Although, "C2" is much weaker than "C1", it still ensures empirical identifiability. Default is "C1". During estimation, under both the "C1" and "C2" constraints, the population means and variances are constrained to be 0 and 1, respectively.

non_pen

the index of an item which is associated with each factor to satisfy "C2". For C1, the input can be NULL

Value

a list containing the following objects:

ra	item discrimination parameters, a $J \times K$ matrix
rb	item difficulty parameters, vector of length J
rc	item guessing parameters, vector of length J
rs	variational parameters s , a $N \times J$ matrix
reta	variational parameters $\eta(\xi)$, a $N \times J$ matrix
reps	variational parameters ξ , a $N \times J$ matrix
rsigma	population variance-covariance matrix, a $K \times K$ matrix
mu_i	mean parameter for each person, a $K \times N$ matrix
sig_i	covariance matrix for each person, a $K \times K \times N$ array

n the number of iterations for the EM cycle Q_mat factor loading structure, a $J \times K$ matrix

GIC model fit index
AIC model fit index
BIC model fit index

lbd numerical value of lasso penalty parameter λ

E3PL_sgvem_rot 39

E3PL_sgvem_rot

Stochastic GVEM for Exploratory M3PL Analysis

Description

Stochastic GVEM for Exploratory M3PL Analysis

Usage

```
E3PL_sgvem_rot(
    u,
    domain,
    samp = 50,
    forgetrate = 0.51,
    mu_b,
    sigma2_b,
    Alpha,
    Beta,
    max.iter = 5000,
    rot = "Promax"
)
```

Arguments

u	an $N \times J$ matrix or a data. frame that consists of binary responses of N individuals to J items. The missing values are coded as NA
domain	the number of factors
samp	a subsample for each iteration; default is 50
forgetrate	the forget rate for the stochastic algorithm. The value should be within the range from 0.5 to 1 . Default is 0.51
mu_b	the mean parameter for the prior distribution of item difficulty parameters
sigma2_b	the variance parameter for the prior distribution of item difficulty parameters
Alpha	the α parameter for the prior distribution of guessing parameters
Beta	the β parameter for the prior distribution of guessing parameters
max.iter	the maximum number of iterations for the EM cycle; default is 5000
rot	the post-hoc rotation method: Promax or CF-Quartimax; default is "Promax", but may also be "cfQ" for conducting the CF-Quartimax rotation

Value

a list containing the following objects:

```
ra item discrimination parameters, a J \times K matrix rb item difficulty parameters, vector of length J rc item guessing parameters, vector of length J rs variational parameters s, a N \times J matrix reta variational parameters \eta(\xi), a N \times J matrix

MGPCM_data

Simulated Data Set for Generalized Partial Credit Model

Description

Simulated Data Set for Generalized Partial Credit Model

Usage

MGPCM_data

Format

A list of components of the data set:

data Item responses

model Loading indicators

params A list of true parameters used for generating the item responses:

...\$a Slopes

MGPCM_gvem 41

```
...$b Negated intercepts
...$theta Latent traits
```

Author(s)

Yijun Cheng <chengxb@uw.edu>

MGPCM_gvem

GVEM Algorithm for the Generalized Partial Credit Model

Description

GVEM Algorithm for the Generalized Partial Credit Model

Usage

```
MGPCM_gvem(
  data,
  model = matrix(1, nrow = J, ncol = 4),
  group = rep(1, nrow(data)),
  iter = 2000,
  eps = 1e-05,
  SE = FALSE,
  verbose = TRUE,
  EFA = FALSE
)
```

Arguments

data	An $N\times J$ matrix of item responses where 0 is the minimal partial credit score (missing responses should be coded as NA)
model	A $J \times K$ matrix of loading indicators (K is the Number of latent dimension)(all items load on the only dimension by default)
iter	Maximum number of iterations
eps	Termination criterion on numerical accuracy
SE	Whether to calculate the standard errors
verbose	Whether to show the progress
EFA	Whether to rotate the output

Value

An object of class vemirt_DIF, which is a list containing the following elements:

```
...$Sigma Group-level covariance matrices
#'
...$MU Person-level posterior mean vectors
```

42 MGRM_data

```
...$a Slopes for group 1...$b Intercepts for group 1...$11 Estimated lower bound of log-likelihood
```

Author(s)

Yijun Cheng <chengxb@uw.edu>

Examples

```
with(MGPCM_gvem, MGPCM_gvem(data, model))
```

Simulated Data Set for the Graded Response Model

Description

Simulated Data Set for the Graded Response Model

Usage

MGRM_data

Format

A list of components of the data set:

data	Item responses
model	Loading indicators
params	A list of true parameters used for generating the item responses:
\$a	Slopes
\$b	Negated intercepts
\$theta	Latent traits

Author(s)

Yijun Cheng <chengxb@uw.edu>

MGRM_gvem 43

MGRM_gvem

GVEM Algorithm for the Graded Response Model

Description

GVEM Algorithm for the Graded Response Model

Usage

```
MGRM_gvem(
  data,
  model = matrix(1, ncol(data)),
  method = "GVEM",
  iter = 200,
  tol = 1e-04,
  S = 10,
  M = 10,
  MinDim = 0,
  MaxDim = 0,
  verbose = FALSE,
  EFA = FALSE
)
```

Arguments

data	An $N \times J$ matrix of item responses where 0 is the minimal partial credit score (missing responses should be coded as NA)
model	A $J \times K$ matrix of loading indicators (K is the Number of latent dimension)(all items load on the only dimension by default)
iter	Maximum number of iterations
tol	Termination criterion on numerical accuracy
S	Sample size for approximating the expected lower bound ('IWGVEM' only)
М	Sample size for approximating a tighter lower bound ('IWGVEM' only)
MinDim	Minimum num of possible dimensions ('EFA' only)
MaxDim	Maximum num of possible dimensions ('EFA' only)
verbose	Whether to show the progress
EFA	Whether to run EFA or CFA
criterion	Information criterion for model selection, one of 'GIC' (recommended), 'BIC', or 'AIC' $$
С	Constant for computing GIC

Value

An object of class vemirt_DIF, which is a list containing the following elements:

```
...$SIGMA Person-level posterior covariance matrices
...$MU Person-level posterior mean vectors
```

pa_poly

\$Sigma	Group-level covariance matrices
\$Mu	Group-level mean vectors
\$ksi1	Variational parameter 1
\$ksi2	Variational parameter 2
\$dim	Num of dimension between latent variables
\$a	Slopes
\$b	Intercepts
\$n2v1b	Bayesian Information Criterion: -2*11+10*log(N)
iter	Number(s) of iterations for initialization

Author(s)

Yijun Cheng <chengxb@uw.edu>

Examples

```
## Not run:
with(MGRM_data, MGRM_gvem(data, method = "IWGVEM", model, EFA = FALSE))
## End(Not run)
```

pa_poly

Parallel analysis using polychoric correlation

Description

Identify the number of factors

Usage

```
pa_poly(data, n.iter = 10, figure = TRUE)
```

Arguments

data	a $N \times J$ matrix or a data. frame that consists of the responses of N individuals
	to J items without any missing values. The responses are binary or polytomous.
n.iter	Number of simulated analyses to perform
figure	By default, pa_poly draws an eigenvalue plot. If FALSE, it suppresses the graphic output

Value

pa_poly returns a data. frame with the eigenvalues for the real data and the simulated data.

Author(s)

Jiaying Xiao <jxiao6@uw.edu>

Examples

```
## Not run:
pa_poly(C2PL_data$data, n.iter=20)
## End(Not run)
```

print.vemirt_DIF 45

print.vemirt_DIF

Print DIF 2PL Items by Group

Description

Print DIF 2PL Items by Group

Usage

```
print(x, criterion = NULL, max = 99999L, digits = 3, ...)
```

Arguments

x An object of class vemirt_DIF

criterion Information criterion for model selection, one of 'AIC', 'BIC', 'GIC', or the

constant for computing GIC, otherwise use the criterion specified when fitting

the model(s)
